

Line Counter

Line counter is an automated application built for the purpose of counting lines of “text” based files.

How It Works

- Line counter is designed to count text files line by line and give the outcome in this format “File name.txt: x lines” e.g., Line Counter.txt: 20 Lines.
- To make use of this application, the user will move the python script to the folder the text file(s) is then run it from there.
- The automation is carried in such a way that when the script is running, it locates any text-based files in the location you are running it from then execute the task.
- It takes optional directory, that is you can work on two directories at ones.

Prerequisites

- Install Python 3.9 ([download here](#))
- Install an IDE (PyCharm is a good [recommendation](#))
